AdaptLIL: A Gaze-Adaptive Visualization for Ontology Mapping

Nicholas Chow

Bo Fu

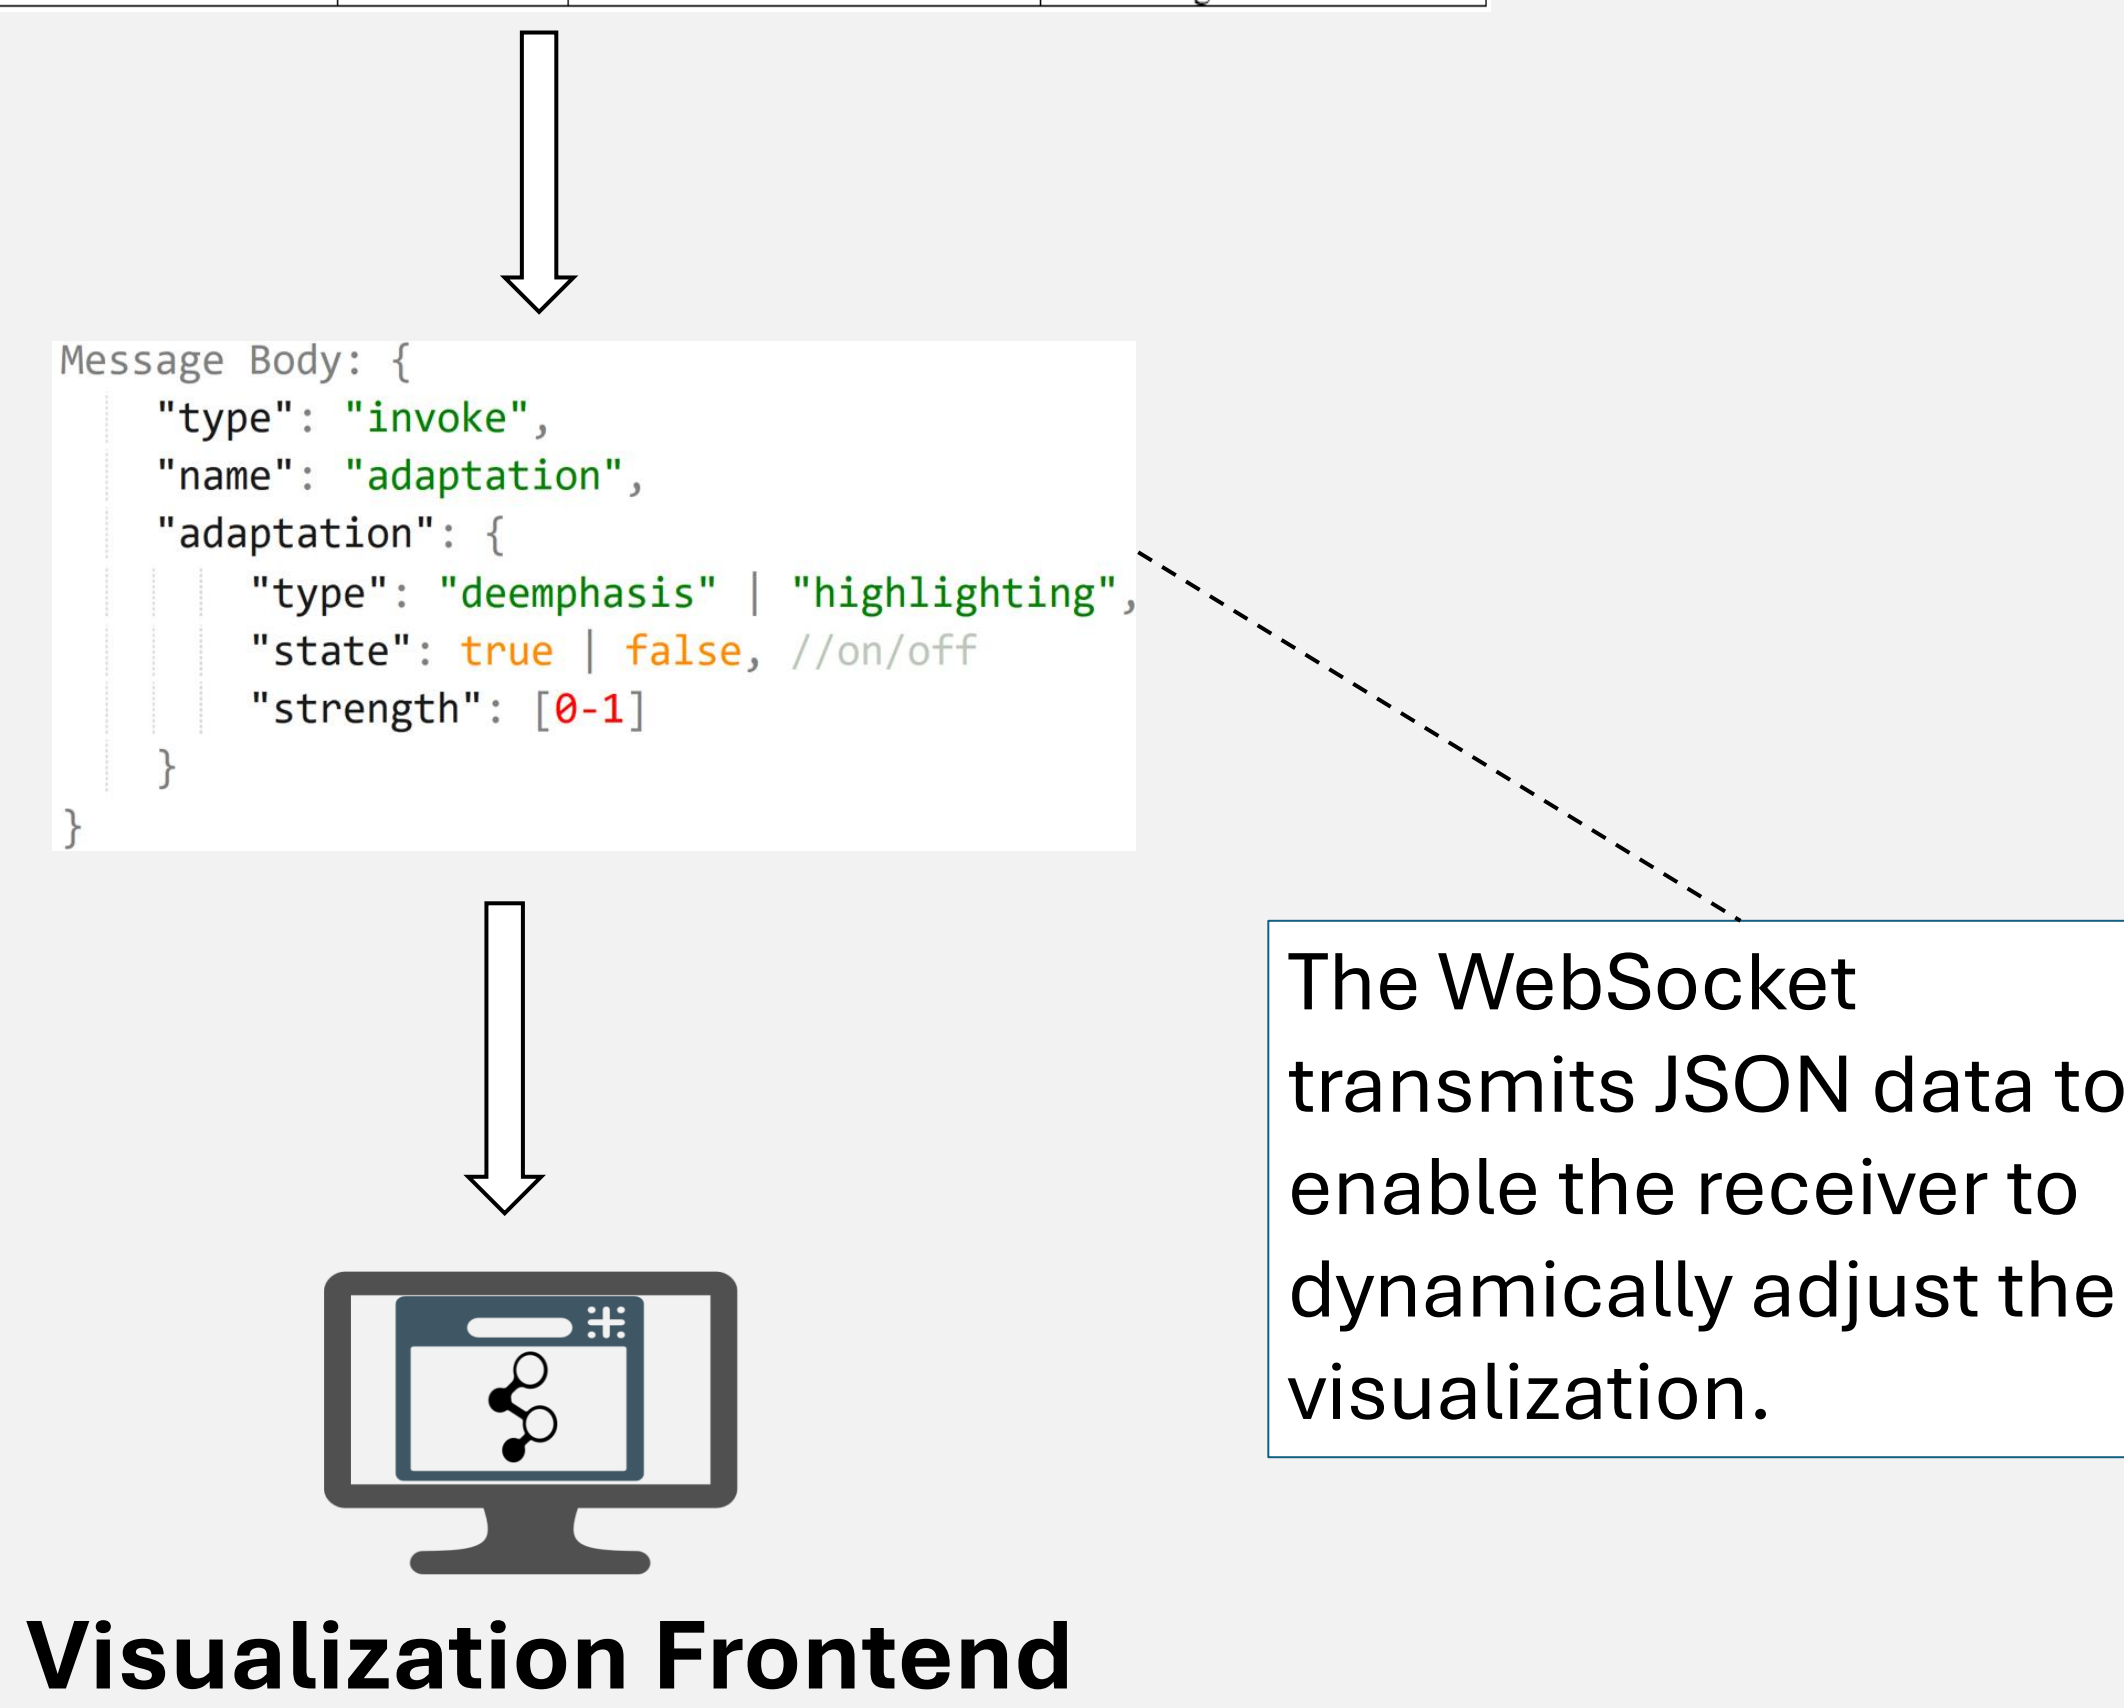

System Design

Start

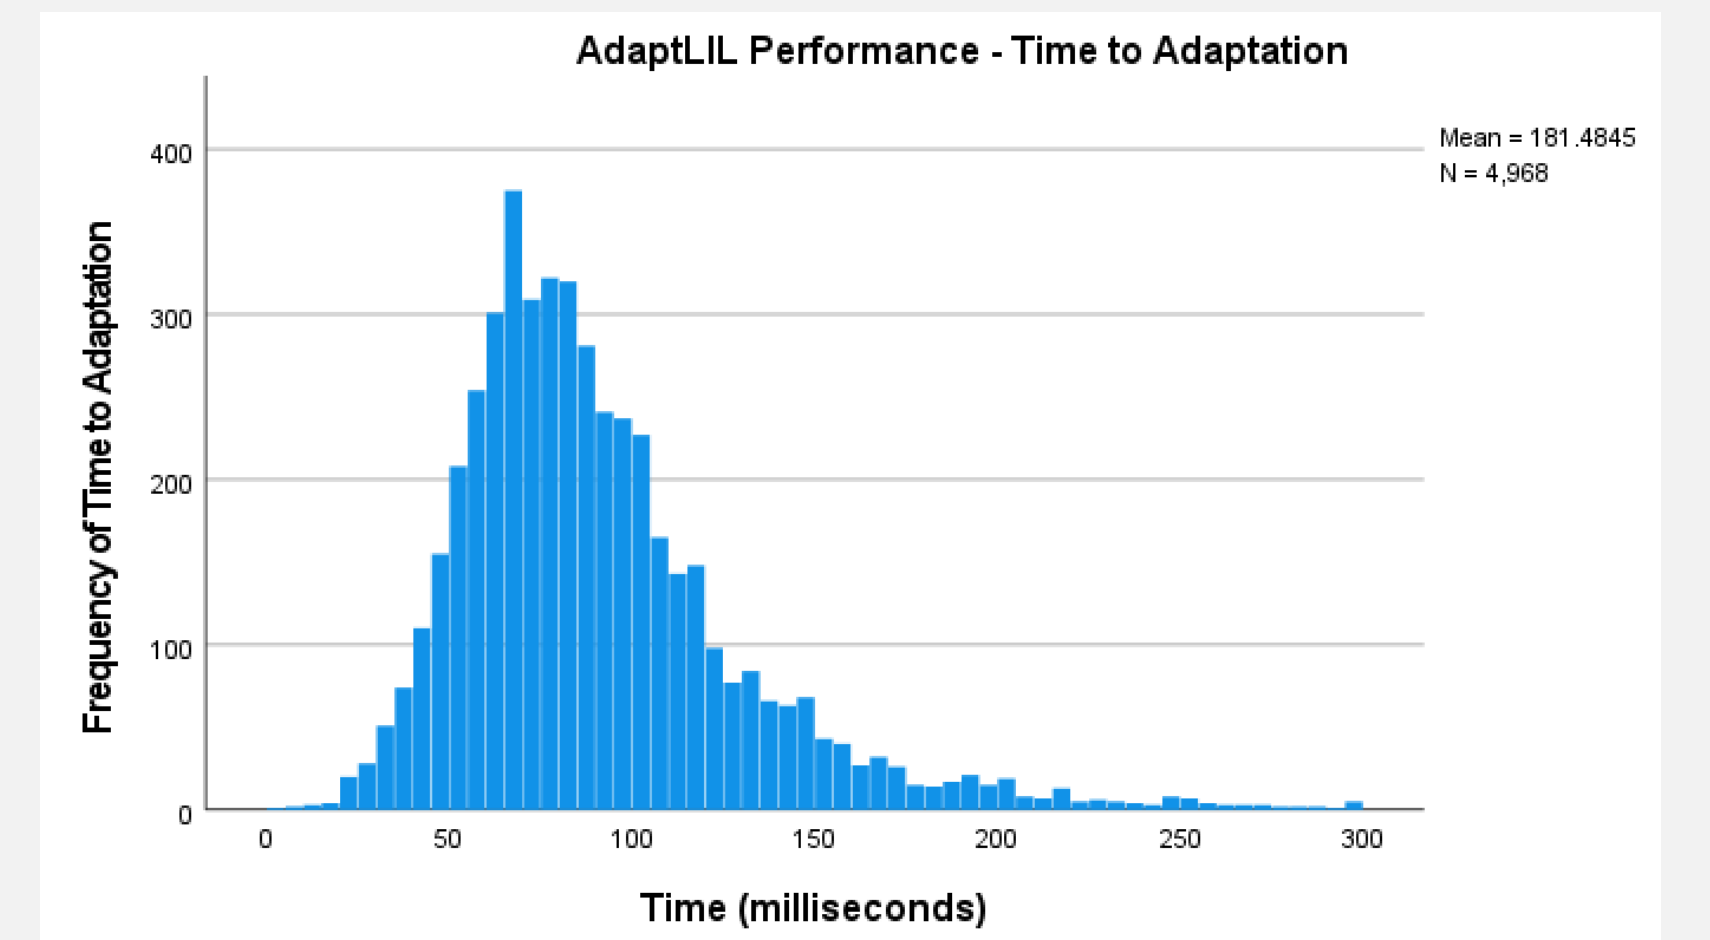

What is AdaptLIL?

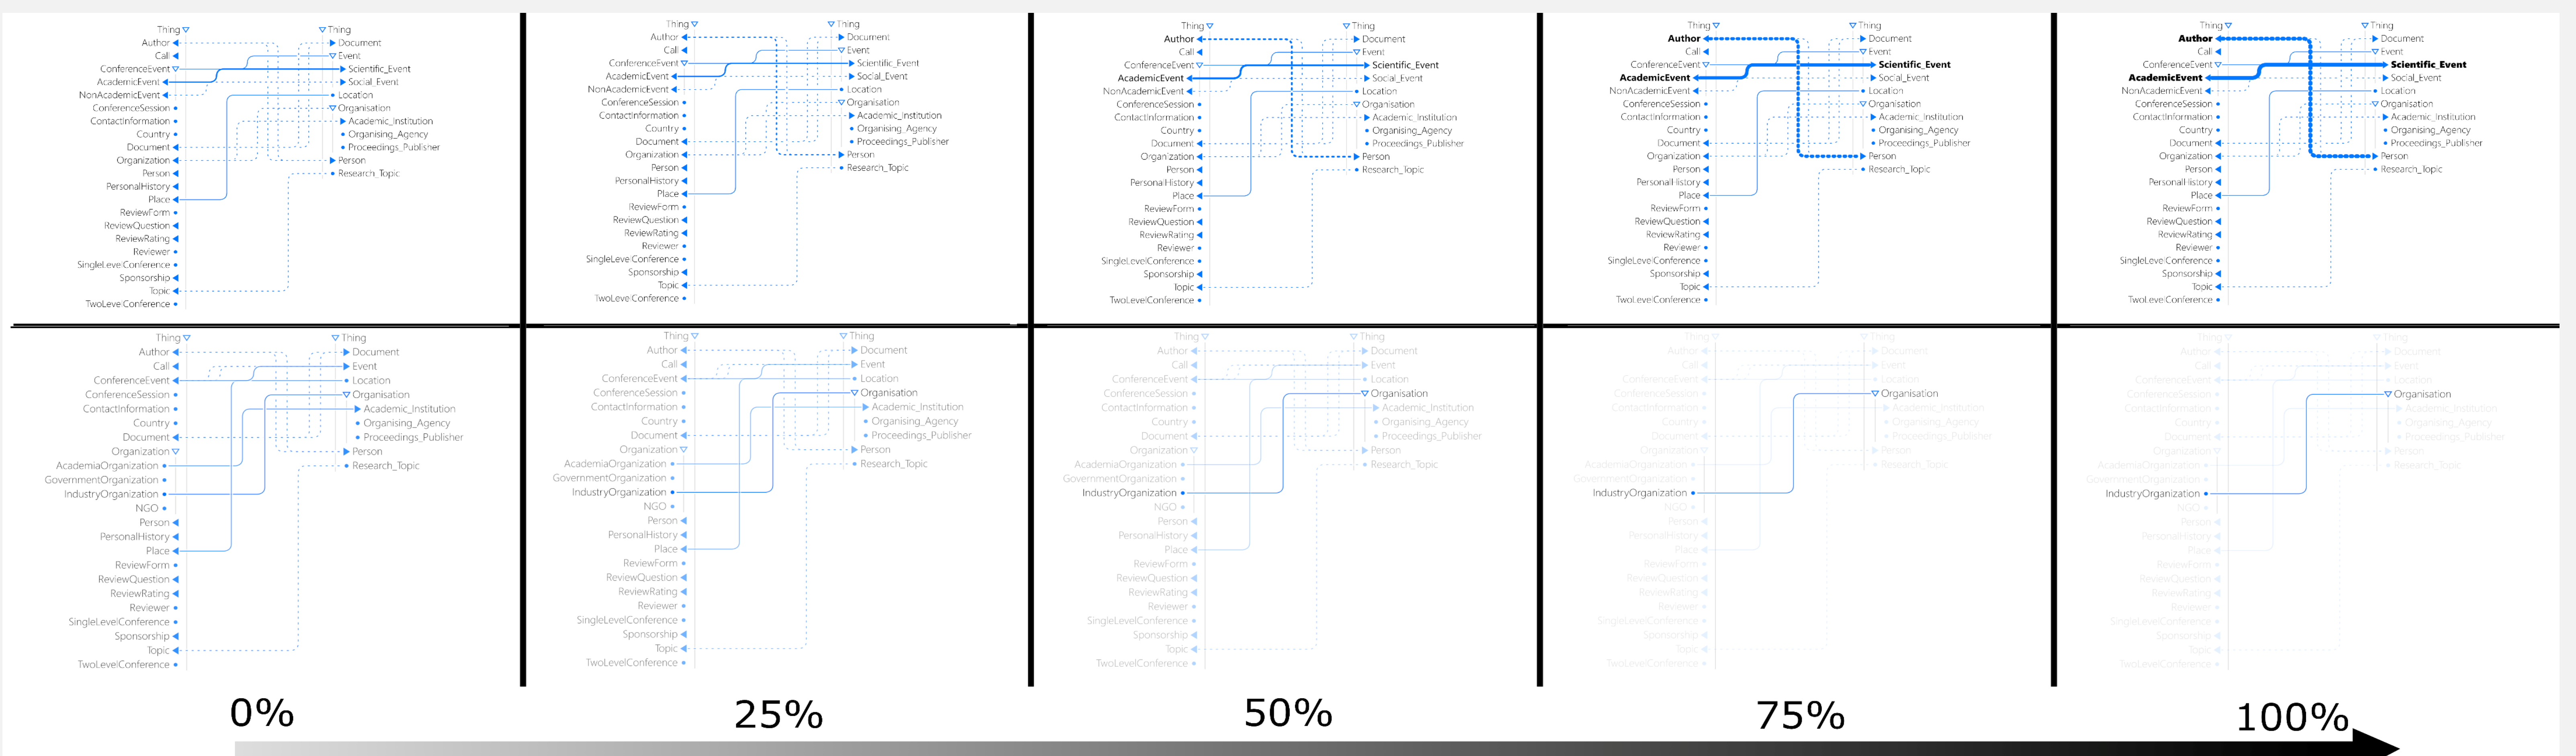

- AdaptLIL is a physiology-driven adaptive indented list visualization for ontology mappings.
- AdaptLIL processes user eye gaze data and adjusts graphical overlays to optimize support during task evaluations.
- AdaptLIL monitors the state and strength of adaptations, adjusting visual prominence when it detects a high likelihood of user failure in a task.
- Results show users are 6% more successful in completing tasks with AdaptLIL compared to a non-adaptive visualization when given the same question set ($p < 0.05$).
- AdaptLIL introduces a novel architecture for building adaptive visualizations, extending beyond just ontology mappings.

Performance

Time-to-adaptation - 180ms
Time for one prediction - 36ms

All Adaptation States of the Visualization

Future Research Directions

- Increasing accessibility of AdaptLIL by using Webcam in place of a dedicated eye tracker
- Different adaptation types such as color schemes and backgrounds
- Identifying the best adaptation type to use depending on given ontology mapping task

Acknowledgements

Thank you to Dr. Bo Fu for providing the resources and guidance to turn this system design into reality.
